

How we tested coordination of microbiome turnover across compartments

For every pair of plants, we calculated microbiome dissimilarity in each compartment and tested whether those distances covaried.

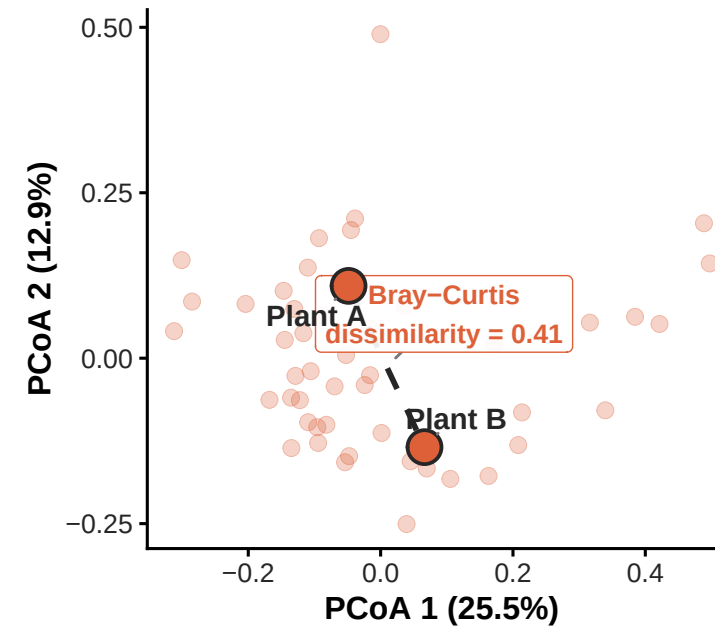

A. Bulk-soil microbiomes

Same two plants highlighted from site 3 (Soil_1m)

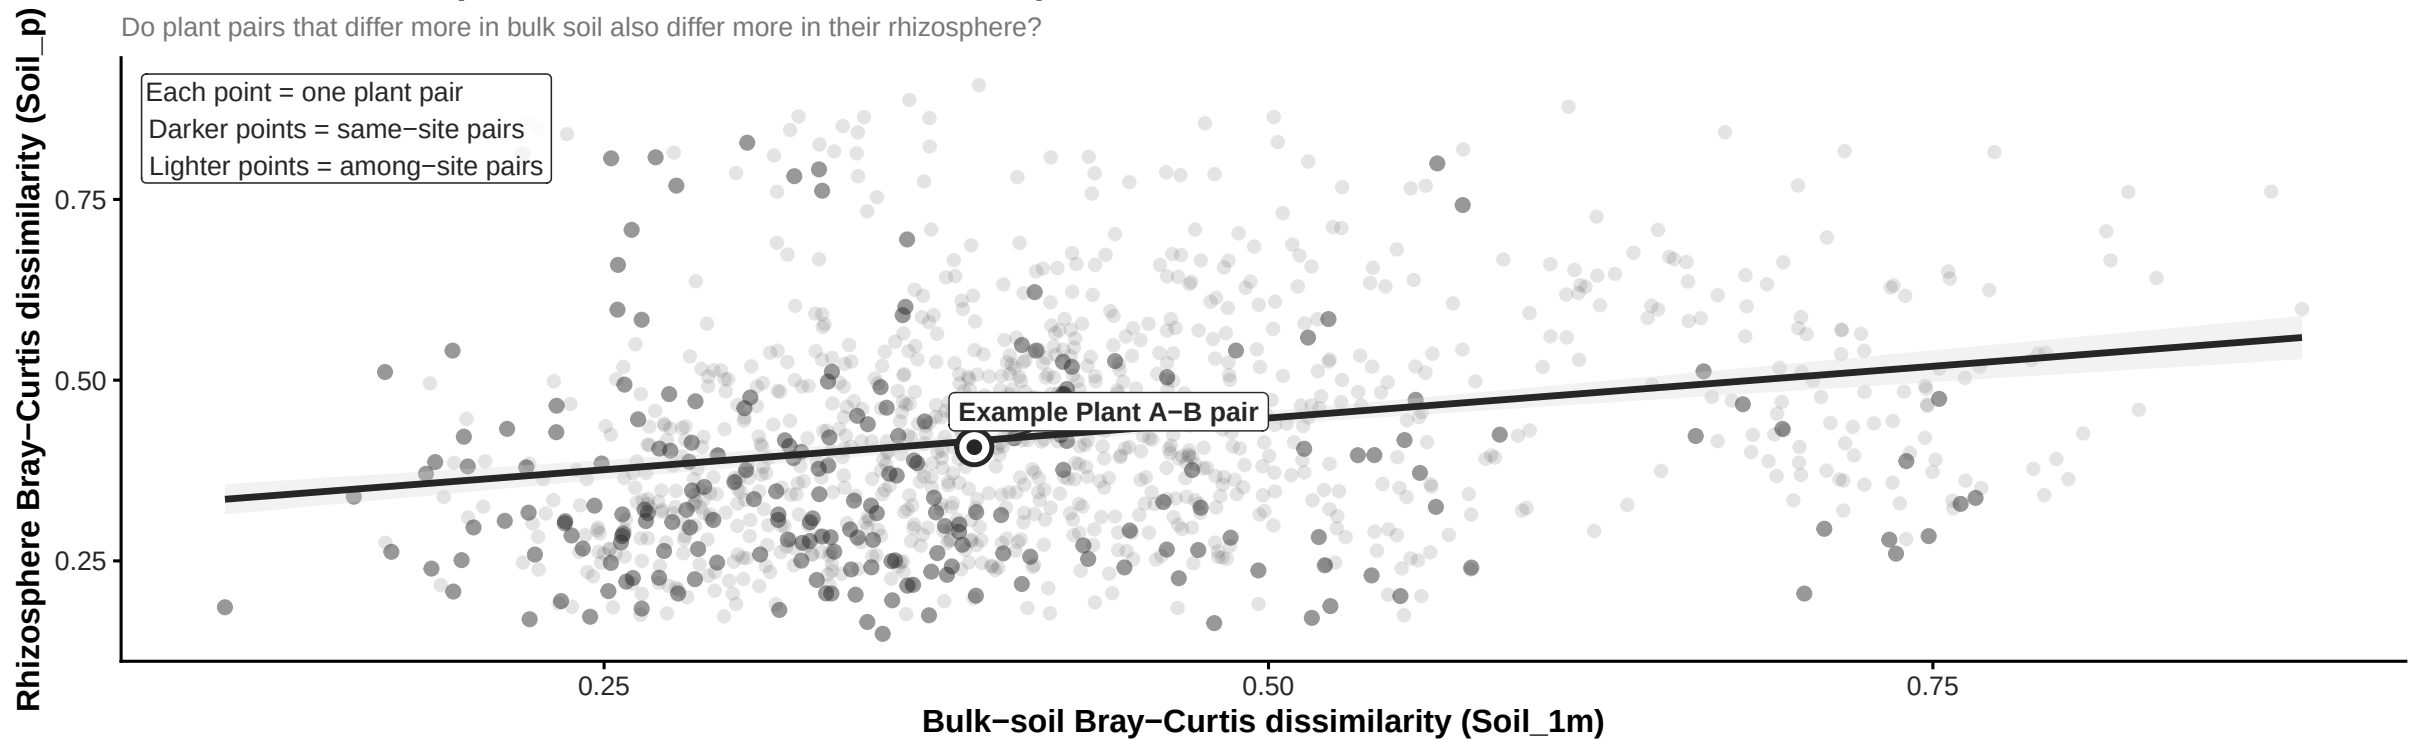

B. Rhizosphere microbiomes

Same two plants highlighted from site 3 (Soil_p)

C. Coordination of pairwise microbiome dissimilarity

Do plant pairs that differ more in bulk soil also differ more in their rhizosphere?

The fitted mixed model accounts for same-site status and repeated use of sites and plants across dyads.
